Security Bulletin DISA-2026-03

Priority: N/A

PHP2Shell Vulnerability: No impact on DI software

Dimensional Insight Security Office &
Dimensional Insight Research and Development Laboratory

Overview

On October 21, 2026, the PHP Group announced patches (https://www.php.net/archive/2026.php#2026-10-21-5) or two severe vulnerabilities in all versions of PHP, Remote Command Execution (RCE) via OOM corruption (CVE-2026-109618) and RCE via stale global state (CVE-2026-109619). These vulnerabilities have been given the name PHP2Shell.

No software that Dimensional Insight distributes uses PHP, so our software is not affected.

When we heard rumors of the vulnerabilities the evening before the global announcement, we locked down DI internal IT systems that used PHP as a precautionary measure. We have since upgraded these systems to use patched versions before making them available again. We are confident that we have not been affected by these vulnerabilities.
